

🧠 Corporate Shadow Resource Detection System (SQL Project)

📌 Project Overview

This project is a SQL-based corporate analytics system designed to analyze employee performance, detect inefficiencies, and identify hidden productivity patterns inside an organization.

It simulates real-world HR analytics used in companies to improve workforce efficiency and decision-making.

🎯 Objective

- Identify underperforming employees (Shadow Resources)
- Detect burnout risks
- Analyze attrition probability
- Evaluate productivity efficiency
- Compare salary vs performance
- Provide data-driven HR insights

🛠️ Tools Used

- MySQL
- SQL (Structured Query Language)
- MS Word / Text Editor
- GitHub

📊 Dataset Used

IBM HR Analytics Employee Attrition Dataset

<https://www.kaggle.com/datasets/pavansubhasht/ibm-hr-analytics-attrition-dataset>

📁 Project Structure

- queries.sql → All database creation, inserts, and analytical queries
- insights.txt → Business insights from analysis
- dataset.csv → Raw dataset
- screenshots/ → Query outputs and results

🔥 Key SQL Features Implemented

- Shadow Resource Detection
- Burnout Analysis
- Attrition Risk Detection
- AI-based Productivity Scoring
- Fraud / Low Output Detection
- Department-wise Performance Analysis
- Promotion Eligibility Logic
- Final Corporate Intelligence Report

📌 Key Insights

- Some employees show low output despite high working hours
- Burnout risk detected in overworked employees
- Salary does not always match productivity
- Departments have different efficiency levels
- Overall workforce efficiency can be improved

💡 Conclusion

This project demonstrates how SQL can be used to analyze real-world HR data and generate meaningful business insights for decision-making in corporate environments.
